

Reliable Functions Developed by the Specialized Valve Manufacturer

Easy Installation | Low Cost | Safe and Secure

New Product!

Operation Recording Unit for Quarter-turn Valves

Tom Probe Series

Recording the valve's operation 24 hours a day, 365 days a year

TPro1100 (Unit main body)

Configuring various settings and collecting data using a PC

TPrn1900 (Application)

Achieving centralized control and status monitoring

TPrn1700 (Remote control unit/Option)

TOMOE VALVE CO., LTD.

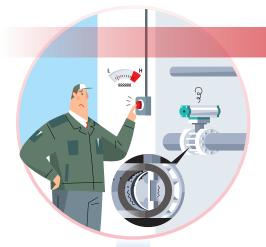

The unit monitors the valve operation and quickly detects abnormalities.

The TPro1100/TPro1900/TPro1700 units, developed by Tomoe Valve, are new devices which record the operational status of quarter-turn valves automatically, 24 hours a day, 365 days a year. TPro1100 quickly detects abnormalities and defects in the valves, and notifies these externally, via various interfaces. TPro1100 is also equipped with a new function, ASF (Active Safety Function) which performs partial stroke

tests periodically, based on the unit's calendar.

Please make full use of the reliable operation recording units, which draw on the technologies and know-how of the specialized valve manufacture, TOMOE.

The operational status data of the valve is saved in the TPro1100 (unit main body) and can be read using a PC. When the TPro1700 (Remote control unit/Option) is also fitted, a maximum of 15 TPro1100 units can be installed. Management and recording of valves located in remote places becomes easy.

Typical Problems of Valve Control

- A valve is in bad shape, but we are not sure of the cause…
- We don't have time to stop the line, disassemble and check the valve…
- If the valve is repaired, the repair will be expensive.
 What should we do?

Before abnormalities or defects of valves occur

Introduction of TOMOE units

Major Advantages

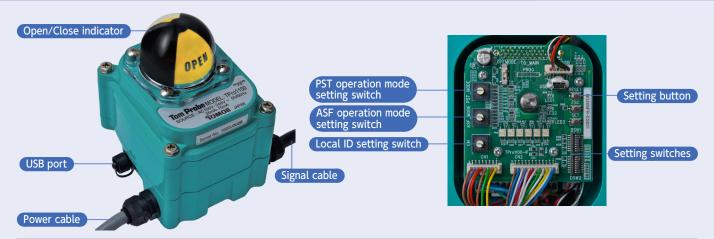

- Operational data on the valve is recorded all the time. Unexpected defects can be detected at an early stage.
- The unit can be operated without specialized knowledge and skills.
- The unit can be easily installed to existing valves.

- Suitable for control and data-recording of air cylinder automatic valves *The unit can be used for quarter-turn valves (including butterfly valves and ball valves).
- The unit can be fitted with newly installed valves or retrofitted.
- Input power supply is AC100V 240V, 50Hz/60Hz.
 The unit can be used in many overseas countries.
- © The operational status data of a valve is saved in the unit main body.
- The unit has advanced functions, such as partial stroke test (PST) and active safety function (ASF).

Recording the Valve Operation 24 Hours a Day, 365 Da

Basic Features

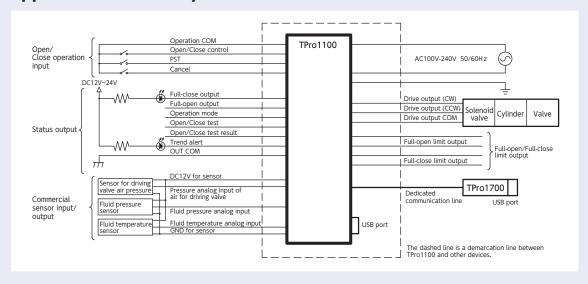

Three Modes

The unit has three modes which can be selected according to the installation and control status of a valve.

of a valve in order to perform open/close control and various tests		Operation mode for recording the open/close control of a valve and the operational status of a valve in order to perform open/close control and various tests
		Operation mode for recording the operational status of a valve which is controlled by devices other than this unit
		Mode for creating settings for various kinds of operation recording

Wiring and **Control**

The unit has various control and output interfaces, and can be applied to both newly installed valves and retrofitted.

Wide-range power supply input

Power supply in overseas countries is supported.

Input power supply is AC100-240V, 50Hz/60Hz. The unit can be used in many overseas countries.

Status Output

The unit transmits the status of the devices in detail.

The unit outputs open/close status, operation mode, abnormal status, etc. from the recording unit to external control devices, such as sequencers. The status of the devices can be transmitted in detail by altering settings in the main body.

Full-close output Full	ull-open output	Operation mode output	Open/Close test output	Open/Close test result output	Trend alert output	
------------------------	-----------------	-----------------------	------------------------	-------------------------------	--------------------	--

^{*}The unit has full-open and full-close limit output in addition to the above-mentioned status output, and can drive loads up to

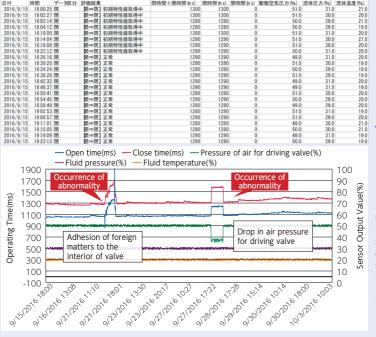

AC250V5A, DC30V5A.

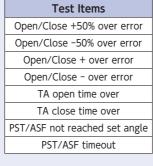

Recording Function/Test Function

Trend Recording

Recording the valve operation 24 hours a day, 365 days a year

The unit records the operational status of the valve all the time. If any abnormal value is detected, the unit provides notification of the abnormality through external output or communication.

Graphing

Graphing the trend data recorded by "TPro1100", using commercial spreadsheet software, allows the operational status of the valve to be viewed more easily.

*Graphing the recorded data requires commercial spreadsheet software, etc. *The values of the recorded data shown here are examples, to explain the function of this unit.

Various Recording Modes

The operational data at opening/closing and in tests is saved in the main unit.

8000 or more units of data can be saved. Values including opening/closing time and commercial sensors (maximum three) can be recorded. The unit has three modes for various tests.

Continuous Mode	When the memory is full, the oldest data is overwritten by new data.
One Shot Mode	When the memory is full, recording stops.
New Function Accumulation Mode	When the memory is full, old data will be reduced, and new data will be saved. Original recording system where new data is accumulated while old data is kept.

Three Commercial Sensor Inputs

Recording three values which give clues to valve abnormality diagnosis.

The unit can capture analog output values from three commercial sensors for temperature, fluid pressure and driving valve air pressure.

This allows valve status to be checked in various aspects. Supported input from sensors is 0 - 20mA or DC0-5V

Partial Stroke Test (PST)

Test function of valve operation is equipped.

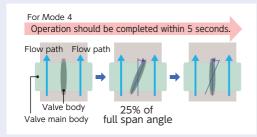

Partial stroke test (PST) is a test method to check the operational status by opening and closing the valve a little. The test can be performed by combining a solenoid valve for driving a cylinder with the "TPro1100", Additionally, ASF function which performs the partial stroke test automatically based on the calendar in the "TPro1100" is inbuilt.

The opening/closing test interval can be selected between every day, every week, and every month.

Step1 Configure the test conditions using the switches on the circuit board.

Start the test performance by signal input from the I/O switch or a remote control unit.

Switches on the Circuit Board

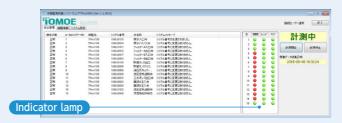

Various Settings and Data Collection Controlled with a PC

TPro1900

Application "TPro1900" is a freeware program which allows configuration of various settings for the unit main body "TPro1100", and allows control of a maximum of 15 units of "TPro1100".

Integrated Management Function

The application displays information of all "TPro1100"units in the network in list form. The indicator lamps on the screen also allow checking of open/close status, trend evaluation results, and open/close test results of the managed valves.

Setting Information

Standand values learned by the "TPro1100" and various settings can be checked. Conditions of the partial stroke test and the adhesion prevention test can be configured. In addition, it is easy to check the "TPro1100" settings, such as the presence of the sensor connected to the "TPro1100", data accumulation mode, detail of outputs to the external devices, simply preventing incorrect settings being used.

Remote Data Collection

The valve operation data accumulated in the "TPro1100" can be collected from a remote area when used in conjunction with the "TPro1700" (Remote control unit/Option). The status of valves located in difficult-to-access areas can be kept track of easily.

Device Information

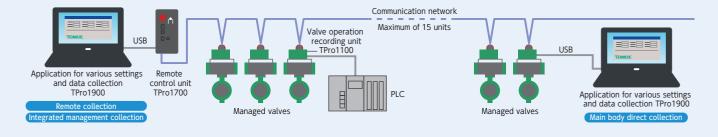

Valve name, date and time can be set in the main body, etc. Additional information, including total operating time and the number of opening/closing, which is required for planning of maintenance, is also available.

Trend Data Collection

The trend data accumulated inside the "TPro1100" can be collected in three ways.

Main body direct collection	Data is collected directly from the USB port on the "TPro1100".	
Remote collection	Data from any designated "TPro1100" unit in the communication network is collected via the "TPro1700".	
Integrated management collection	Data from each "TPro1100" unit in the communication network is collected via the "TPro1700".	

Achieving Centralized Control and Status Display

Relay Function

The unit has a function for creating a communication network, connecting the "TPro1100" main body unit to a PC with the "TPro1900" application installed. A maximum of 15 "TPro1100" units can be controlled.

Saving on Wiring

Installation requires only two cables for communication and a power supply cable to the unit.

Reduced Installation Costs

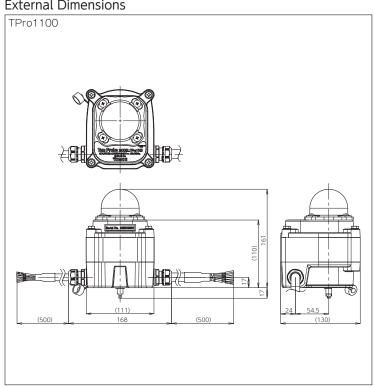

Since the unit is equipped with control switches and LED status display lamps, no separate control board is required.

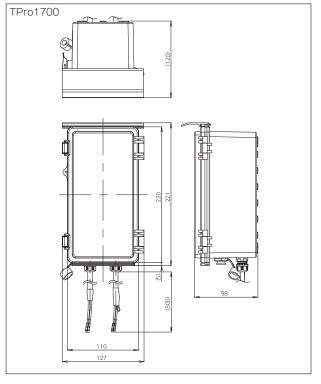

Specifications

Item	TPro1100	TPro1700	
Attachment shape	VDI / VDE3845 Rotary Actuators(Quarter-turn) and Auxiliary Equipment	Attachment with various stays	
Dust-proof and waterproof	IP65 equivalent		
Conduit tube connection	500 mm length for both power sup	ply cable and communication cable	
Main body main material	Aluminum die-casting	Main body: ABS resin	
Display function	Open/Close indicator	LED open/close indication, power indicator lamp, test result indication, controlled unit ID 7-segment indication	
Power supply voltage	AC100V-AC240V Single-phase 50/60Hz		
Ambient operating temperature	-20°C - 80°C (No condensation)	-20°C - 50°C (No condensation)	
Ambient storage temperature	-20°C - 80°C (No condensation)	-20°C - 60°C (No condensation)	
Interface specifications		◆ Switch input (Open/close instruction, PST instruction) ◆ Compliance with USB standards ◆ TOMOE's dedicated communication (RS485)	
Functions Solenoid valve direct drive function ◆ PST function (One mode out of 13 modes is selected.) ◆ ASF function (One mode out of 13 modes is selected.) ◆ Trend data logging function (8000 data for each Open, Close, PST and ASF are held in the main body.)		◆ Communication gateway function (USB-RS485) ◆ Supply of operation instructions to a selected unit	

External Dimensions

Tom Probe-

is a newly-coined term that comes from our company name "Tomoe Valve", combined with "Probe". Probe means investigation or examination. It also refers to a device for checking the status of a target object.

Thus, Tom Probe is the name of a series of Tomoe Valve products which include devices which probe valve status.
