

TG-S

The TG-S type spring return pneumatic actuator is suitable for on/off control for medium and large sized valves. Air pressure and the spring force the piston inside the cylinder into a linear reciprocating motion, causing the pin coupled to the piston rod to rotate the output shaft.

TG-S Operation principle

As shown in the picture on the right, the chamber A₁ is connected to the chamber A₂ with copper tubes. The same is true for chamber B₁ and B₂. Operating air is supplied through port "O" and fills chambers B₁ and B₂. The air moves pistons ① and ② to the right, so that the spring is tensed. when thrust is transmitted to the pin on the piston rod to give the output shaft a force to produce counter-clockwise rotation through the arm, which rotates the shaft counter-clockwise. Residual air in chambers A₁ and A₂ is exhausted through port "S". During air failure mode, the spring forces the piston ② to move left, when thrust is transmitted to the pin on the piston rod to give an output shaft a force to produce clockwise rotation through the arm, which rotates the shaft clockwise.

TG-S Air consumption

Type	Cylinder capacity (ℓ)
TG-10S	3.59
TG-12S	6.36
TG-14S	12.56
TG-20S	36.29

(1) Required air consumption

Single-acting type

$$VS = V \left(\frac{P + 0.1013}{0.1013} \right) N$$

VS : Single-acting type cylinder air consumption (Nℓ)

V : Cylinder capacity(ℓ)(V₁+V₂)

P : Working pressure (Mpa)

N : Operating frequencies in a given time (1 round trip=1)

(2) Air consumption within a unit time

Single-acting type

$$CS = \frac{VS}{t}$$

CS : Single-acting type cylinder air consumption (Nℓ/sec)

t : Unit time (sec)

Remark: The compressor should have a larger capacity than the air consumption calculated in above in (1) and (2).

TGS Output Torque Curve

● Single-acting type (spring returned type)

Notes :

- This table shows 3U (spring shut). In the case of 3K (spring open), the rotation angle is reversed.
- — Lines show output torque curve by actuator
- - - - Lines show output torque for spring force(air less)
- The table shows the torque at an operating air pressure of 0.4 Mpa.
- It can be used with an operating pressure between 0.4MPa and 0.7MPa.
- When the operating pressure is increased from 0.4MPa, the output at air fail does not change.

Example of standard air circuit for control operation (single-acting type)

Shown below are examples of standard circuits in which the P/P or E/P positioner is attached to the butterfly valve driven by a single-acting pneumatic cylinder to adjust valve opening exactly and quickly in proportion to the signals transmitted by a local controller or from a remote control room. This will also detect the open/close position of the valve by a limit switch which sends feedback of the electric signals to the control room. When the operating air supply or power supply fails, the valve is automatically operated to the safe side of open or close.
