Worm Gear

Pneumatic Cylinder

Motorized

Features and Benefits

For various applications such as air conditioning systems, pulp and paper mills, steel mills, chemical plants, food processing and many other process industries, the 507V rotary control valve will support your fluid control requirements.

Flexible control over a wide range

The 507V allows complete control over the full range from the open to the closed position. The valve can also handle high temperatures of up to 400 degrees C such as in steam lines and it will respond quickly and flexibly to any changes within the operating parameters of the process line. The 507V therefore is the optimum valve for any control system processing multiple products where the operating conditions change from time to time in accordance with process requirements.

Model 507V is the high temperature version of our rotary control valve designed for exclusive use in the regulation of fluids.

Cost-effective rotary control valve

In spite of its compact size and light weight, the 507V has a large valve capacity that minimises the energy loss of fluid at the fully open position.

This compact design reduces the required size of the actuator, installation space and piping supports. It also minimises vibration of control systems and increases the operating life.

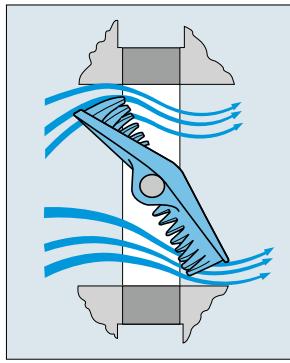

These features provide the benefit of reducing the total operating cost of your plant.

General Description

The high performance characteristics of this model originate from its unique design with a teeth and gull-wing shaped disc that touches the seat at a certain angle (Fig.1). The teeth are arranged on the circumference of the disc towards either direction of flow. The 'touch-at-an-angle' disc assists the reduction of seating and unseating torque and facilitates smooth control of the valve.

Other benefits include high rangeability, low noise level and anticavitation.

This model covers a wide temperature range in the fluid control of air conditioning systems, pulp and paper mills, chemical plants, steel mills and food processing applications.

General

With guide-vane-like teeth around the disc edge, and the disc touching the seat at a certain angle, this product is a compact, lightweight and highly cost-effective, high-performance rotary control valve that exhibits outstanding control characteristics. The valve provides steady control over a wide range with higher rangeability, better cavitation resistance, lower dynamic torque, lower noise level, and a better leakage rate than any other rotary control valve.

Two models, the 507V and 508V, are available for a range of severe applications. The 507V is the optimum type for fluid control of high pressure, high temperature systems. The 508V is characterized by its rubber seat ring, and eliminates the need for any additional stop valve because of its complete sealing capability.

Fundamental Structure

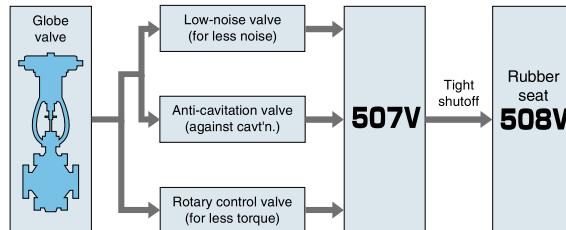

This product has two basic design features that are responsible for the outstanding performance. One is the teeth around the disc and

the other is the gull-wing-like design of the disc.

The teeth on the circumference of the disc break up the fluid energy acting on it with a resultant reduction of pressure recovery.

Unlike conventional flat discs, the gull-wing-like disc of the product touches the seat at a certain angle for reduced seating/unseating torque. This results in steady control of the valve.

Recent trend toward rotary type control valves

Rotary Control Valve with Tight Shut-off and High Grade Rubber Seat

508V

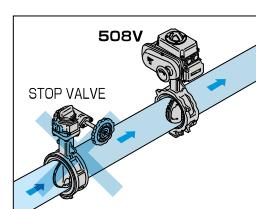

Except for the rubber seat ring, the 508V has the same design principle as the 507V. Excellent controllability is achieved by having the innovative teethed disc seating at a certain angle. The 508V has a reinforced core rubber seat ring allowing it to be used for high pressure service up to 1.6MPa with complete tight shut-off.

Rubber seat ring with a "control cosine curve" profile

Taking into consideration the cosine curve profile rubber seat ring incorporated into our models 700G and 773Z, we developed a new type of seat ring for exclusive use in the 508V. The 508V has a reinforced core rubber seat ring incorporated with a "control cosine curve" profile for sizes between 50mm and 200mm. This seat ring design ensures a tight shut-off up to a working pressure of 1.6MPa. The 508V available in sizes between 250mm and 350mm has a similar seat ring design and profile, but the seat ring is backed up by a precisely formed metal core which is encapsulated inside the rubber. This design enables the control valve to function under severe conditions of high velocity, a large differential pressure or a high vacuum. (The maximum allowable shut-off pressure is 1.0MPa).

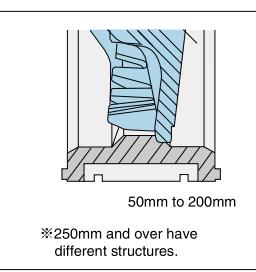

No additional stop valve, less installation space and less cost

Because of its reliable sealing effect against a high differential pressure, the 508V does not require an additional stop valve. You save on installation space and benefit from the excellent cost effective features of our rotary control valve.

Satisfies both JIS and ISO standards for extended applications

The 508V is available in different flange specifications. Also, its face-to-face dimension meets both JIS and ISO requirements. Therefore this model is applicable for various industrial applications worldwide.

General

With guide-vane-like teeth around the disc edge, and the disc touching the seat at a certain angle, this product is a compact, lightweight and highly cost-effective, high-performance rotary control valve that exhibits outstanding control characteristics. The valve provides steady control over a wide range with higher rangeability, better cavitation resistance, lower dynamic torque, lower noise level, and a better leakage rate than any other rotary control valve.

Two models, the 507V and 508V, are available for a range of severe applications. The 507V is the optimum type for fluid control of high pressure, high temperature systems. The 508V is characterized by its rubber seat ring, and eliminates the need for any additional stop valve because of its complete sealing capability.

Fundamental Structure

This product has two basic design features that are responsible for the outstanding performance. One is the teeth around the disc and the other is the gull-wing-like design of the disc.

General Description

With a specially designed rubber seat ring, Model 508V ensures tight shut-off and eliminates the need for any additional stop valve required by conventional control valves.

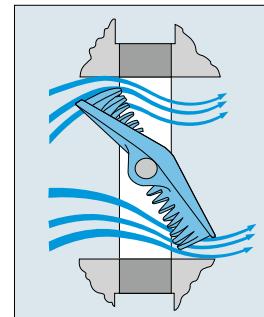

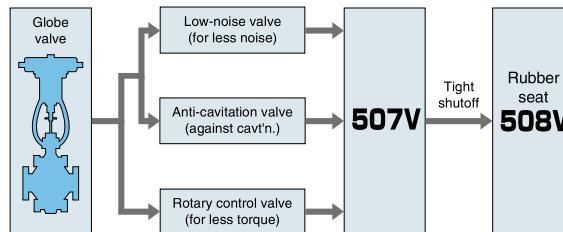

The high performance characteristics of this model originate from its unique design with a teeth and gull-wing shaped disc that touches the seat at a certain angle (Fig.1). The teeth are arranged on the circumference of the disc towards either direction of flow. The 'touchat-an-angle' disc assists the reduction of seating and unseating torque and facilitates smooth control of the valve. Other benefits include high rangeability, low noise level and anti-cavitation.

The face-to-face dimension meets both JIS and ISO standards so the 508V is applicable for various industrial fields including air conditioning systems.

The teeth on the circumference of the disc break up the fluid energy acting on it with a resultant reduction of pressure recovery.

Unlike conventional flat discs, the gull-wing-like disc of the product touches the seat at a certain angle for reduced seating/unseating torque. This results in steady control of the valve.

^{※1} As for 65mm and 125mm, please consult us.

^{※2} 350mm only : JIS B 2002 Series 47 / ISO Basic Series 25 (Medium)

^{※3} Working temperature in continuous use stands for the temperature continuously kept exceeding on hour.

^{※4} If the fluid contains chlorine, EPDM and NBR seat ring may deteriorate early due to combined factors including density and temperature.

In this case, 846T/847T(PTFE seated) is recommended. For details consult us.

Do not use an EPDM seat ring if the fluid contains even a slight amount of oil.

^{※5} Rangeability of 65mm and 125mm is 50:1.

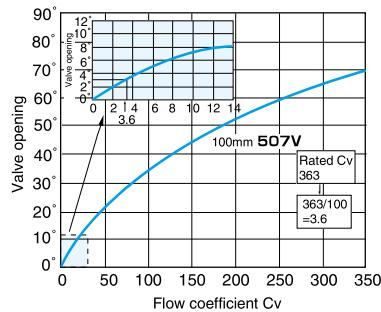

507V / 508V

Multiple merits for multiple applications

Controllability

High rangeability

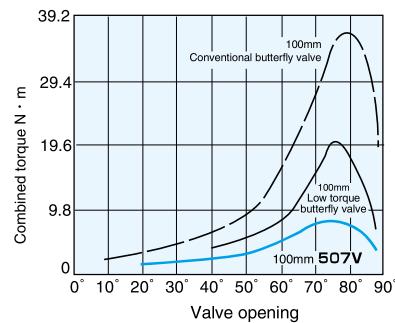

- *The wide range of controllability permits flexible adjustment to any changes in the process conditions of production lines. This merit is especially beneficial to multifold productions.
- *The conventional "split range control" with twin valves is no longer required. One product is enough to cover the whole range.

With its nearly "equal percent" flow characteristics and its very low leakage rate, the product offers an extremely high rangeability of 100:1.

Low dynamic torque

- *The steady performance ensures more precise control.
- *The compact actuator saves space and energy.

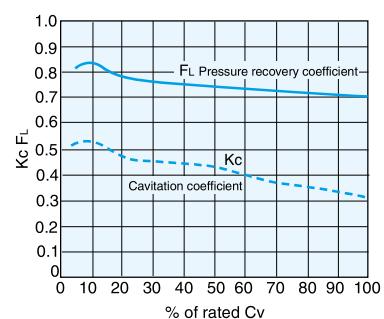

The above graph shows a comparison of the product with other typical valves. The patented disc has remarkably reduces the dynamic torque.

Reliability

Excellent cavitation resistance

- *The outstanding cavitation resistance increases the operational life of the valve and pipeline, and improves the reliability of the system.
- *This model is works in more severe requirements than ever.

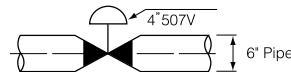

A high coefficient of initial cavitation (KC), and a high pressure recovery coefficient (FL), inhibit the occurrence of cavitation.

Environmental considerations

Low noise level

*Provides better work environment.
*Especially in air and gas applications, this product has a lower noise level by 5 to 10dBA and meets and exceeds noise regulations

The teeth on the disc cut the flow into fine jet streams.
This is the most effective device for lowering the noise level when the valve is half open.

Cost merit

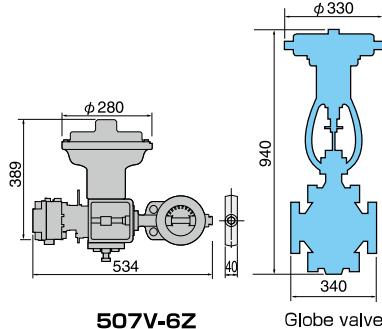

Larger valve capacity

*Reduces loss of energy at the fully open position.
*Allows one to two sizes of valve reduction in comparison with a conventional valve.

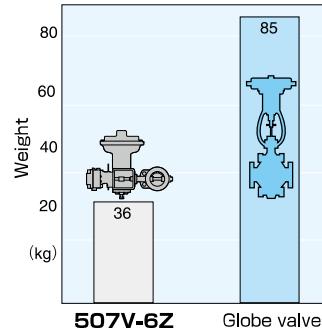

Compact and lightweight design

*Permits compact piping arrangement.
*Allows the use of a portable remote controller unit.
*Eliminates vibration problems of the piping system, and improves operational life.

Comparison of dimensions
(Nominal size: 80mm)

Comparison of weight
(Nominal size: 80mm)

Simple design

*Permits easy control of spare parts.
*Facilitates easy maintenance.
*Has a reduced number of parts and improved reliability.

Remark1: ○=Applicable ×=Not applicable

Remark2: Butterfly valves are inserted into a pipe that was fitted with the disc when fully open.

In cases where you are using a pipe or flange that is less than the minimum inner pipe diameter, use is still possible if means are taken such as inserting a spacer between the valve and flange. For details, please consult us.

508V Maximum velocity

| | | |
|---------------------|--------------|-------|
| Fresh water | Short period | 10m/s |
| | Continuous | 7m/s |
| Sea water | Short period | 10m/s |
| | Continuous | 5m/s |
| Air (ambient temp.) | Short period | 80m/s |
| | Continuous | 30m/s |

The maximum velocity shown is estimated as an average in the fully open state.

Remark: "Short period" means a few minutes creating high velocity until the disc angle reaches the designated position.

Remark 1: ○=Applicable ×=Not applicable

Remark 2: Butterfly valves are inserted into a pipe that was fitted with the disc when fully open.

In cases where you are using a pipe or flange that is less than the minimum inner pipe diameter, use is still possible if means are taken such as inserting a spacer between the valve and flange. For details, please consult us.

Remark: Bolt and nut material: SS400/SS400 and SUS 304/SUS04.

Long bold uses full threaded bolt.

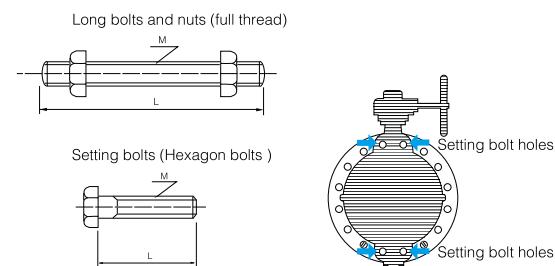

Use thin hexagon nut. (Use heavy hexagon nut for ASME class 150.)

A unified screw should have 8 threads per inch if its nominal diameter exceeds 1 inch.

Example

Long bolts: 12 - M22 × 185
 | | |
 N M L

Setting bolts: 4 - M30 × 95
 (Hexagon bolts) | | |
 N M L
